REMARKS

As pointed out on page 4 in the description of Figure 7, the two integrally molded frame members are press fitted together into interengaging relationship to retain the glazing unit within the retaining recess or channel formed on assembly of the two frame members. This aspect of the invention is again discussed on page 7 of the specification, lines 21 to 24. The additional claims now added to claim this feature, namely, that the frame members are molded with means which interengage when the frame members are fitted one against the other to hold the frame members in such fitted relation. Nowhere in the prior art is there any discussion of such integrally molded frame members.

Respectfully submitted,

Agent on behalf of Applicant
